

ABSTRACT OF THE DISCLOSURE

[00071] A digital image device is provided that displays one or more digital images, as well as adaptively displays an icon proximally to a selected image in accordance with manipulation of a direction key by a user when selecting which digital image(s) to display. The icon indicates not only a current position or active image but also the moving direction of desired image review. The icon can be stored as separate forward and backward direction icons that are selected as needed, or a single direction icon that is rotated as needed, depending on whether the user selected the next or a previous one of sequential images for display. When the digital image device displays multiple images simultaneously, the icon is moved from a selected image to the next selected image, and the direction the icon changed depending on image review direction.
